

TERRA AQUA CORNER CLOSURE

The "corner closure" is designed specifically to speed the gabion installation process. When adjoining adjacent gabion baskets the corner selvedge wires are often times positioned so that properly confining these required vertical wire is tedious.

Each jaw is designed at a specified angle to insure the corner wires of each gabion basket are brought together when the handles are pressured inward. Once the handles are brought together they may be locked into position by using the serrated locking device located on the handle of the corner closure.

Although the vertical gabion seam will "zipper" close if the initial Tiger- Tite is applied at the bottom or lowest joint location, an additional corner closure may be applied at a location 6-12 inches above to insure an aesthetic, straight and structurally sound gabion joint.

This labor saving aid is designed to insure a speedy, profitable gabion project. Contact your "Authorized Terra Aqua Distributor" for other accessories that will help you provide consistent quality gabion construction.
